What if at each step of decoder! Sutskever et al, "Sequence to sequence learning with neural networks Treat 19004?

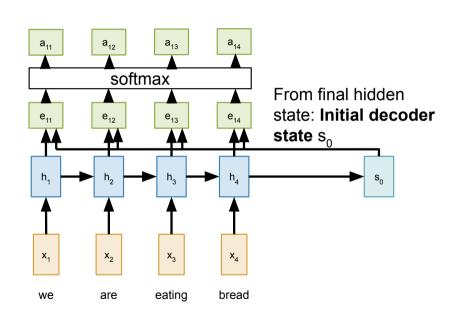

**Input**: Sequence  $x_1, ..., x_T$ **Output**: Sequence  $y_1, ..., y_T$ 

**Encoder:**  $h_t = f_W(x_t, h_{t-1})$  From final hidden state: Initial decoder state  $s_0$ 

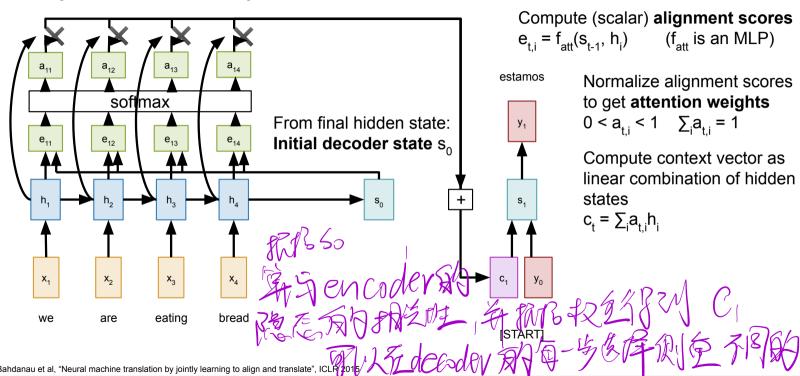

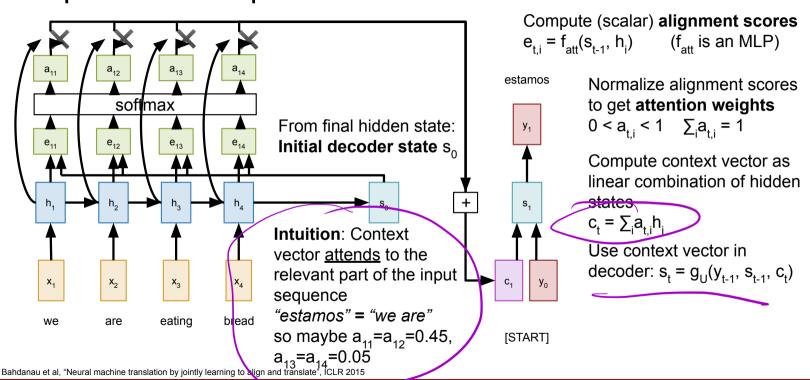

Compute (scalar) **alignment scores**  $e_{t,i} = f_{att}(s_{t-1}, h_i)$  ( $f_{att}$  is an MLP)

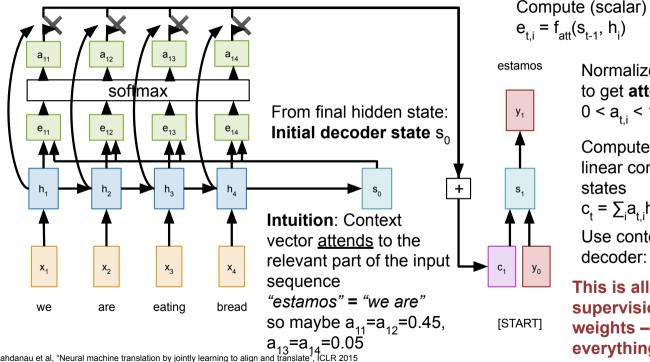

Compute (scalar) alignment scores  $e_{t,i} = f_{att}(s_{t-1}, h_i) \qquad (f_{att} \text{ is an MLP})$ Normalize alignment scores to get attention weights  $0 < a_{t,i} < 1 \quad \sum_{i} a_{t,i} = 1$ 

Compute (scalar) alignment scores  $e_{t,i} = f_{att}(s_{t-1}, h_i)$  ( $f_{att}$  is an MLP)

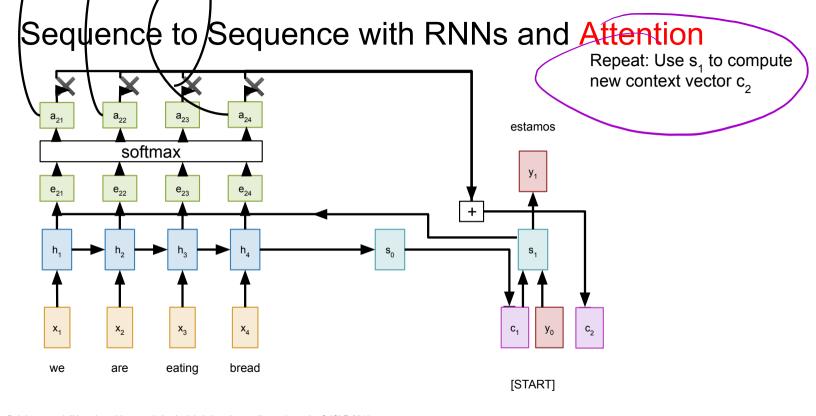

> Normalize alignment scores to get attention weights  $0 < a_{i} < 1$   $\sum_{i} a_{i} = 1$

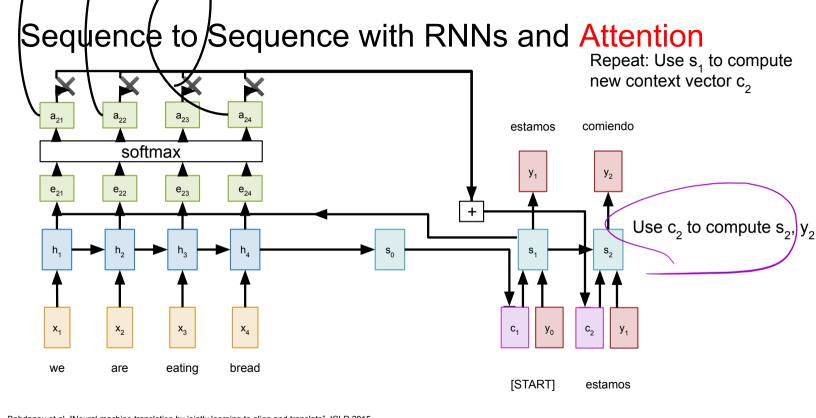

Compute context vector as linear combination of hidden

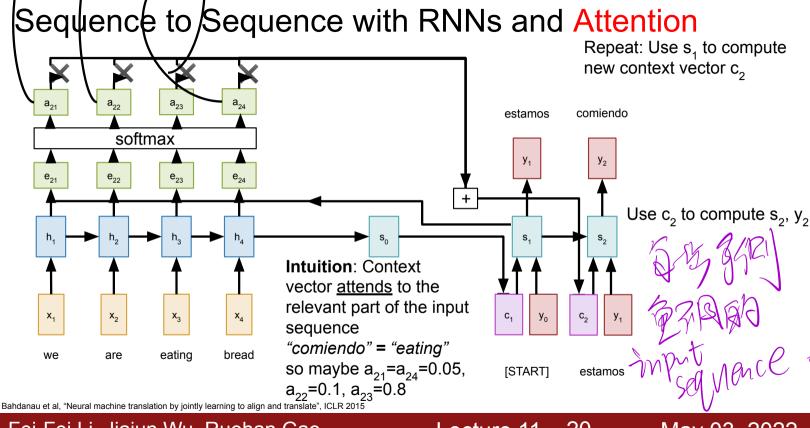

$$c_t = \sum_i a_{t,i} h_i$$

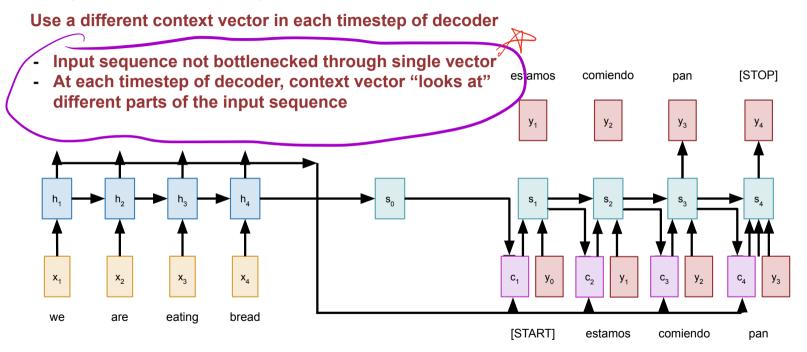

Use context vector in decoder:  $s_t = g_{11}(y_{t-1}, s_{t-1}, c_t)$ 

This is all differentiable! No supervision on attention weights – backprop through everything

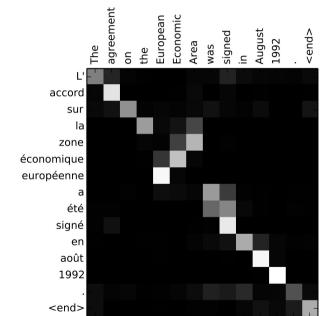

**Example**: English to French translation

**Input**: "The agreement on the European Economic Area was signed in August 1992."

**Output**: "L'accord sur la zone économique européenne a été signé en août 1992."

Visualize attention weights a<sub>t,i</sub>

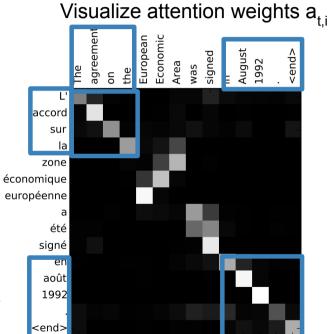

**Example**: English to French translation

Input: "The agreement on the European Economic Area was signed in August 1992."

Output: "L'accord sur la zone économique européenne a été signé en août 1992."

Diagonal attention means words correspond in order

Diagonal attention means words correspond in order

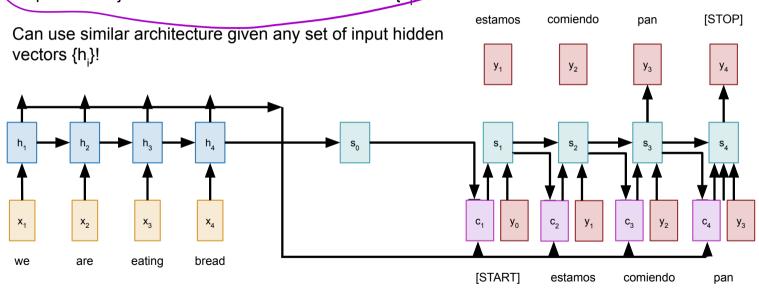

**Example**: English to French translation

Input: "The agreement on the European Economic Area was signed in August 1992."

Output: "L'accord sur la zone économique européenne a été signé en août 1992."

Visualize attention weights a, **Diagonal attention means** accord words correspond in order sur la zone Attention figures out économique different word orders européenne été signé en août **Diagonal attention means** 1992 words correspond in order

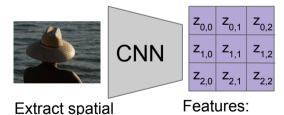

The decoder doesn't use the fact that h<sub>i</sub> form an ordered sequence – it just treats them as an unordered set {h<sub>i</sub>}

Input: Image I

features from a pretrained CNN

**Output:** Sequence  $y = y_1, y_2, ..., y_T$ 

Xu et al, "Show, Attend and Tell: Neural Image Caption Generation with Visual Attention", ICML 2015

HxWxD

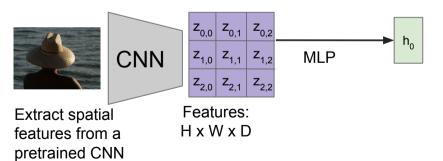

Input: Image I

**Output:** Sequence  $y = y_1, y_2, ..., y_T$ 

**Encoder**:  $h_0 = f_w(z)$ 

where **z** is spatial CNN features

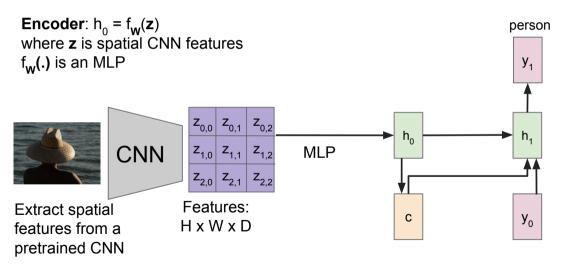

f<sub>w</sub>(.) is an MLP

Input: Image I

**Output:** Sequence  $y = y_1, y_2, ..., y_T$ 

**Decoder**:  $y_t = g_v(y_{t-1}, h_{t-1}, c)$ where context vector c is often  $c = h_0$ 

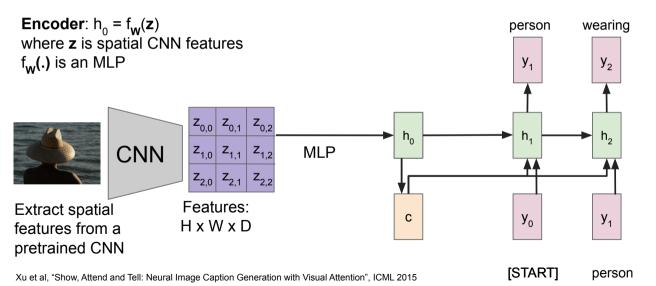

Xu et al, "Show, Attend and Tell: Neural Image Caption Generation with Visual Attention", ICML 2015

[START]

Input: Image I

**Output:** Sequence  $y = y_1, y_2, ..., y_T$ 

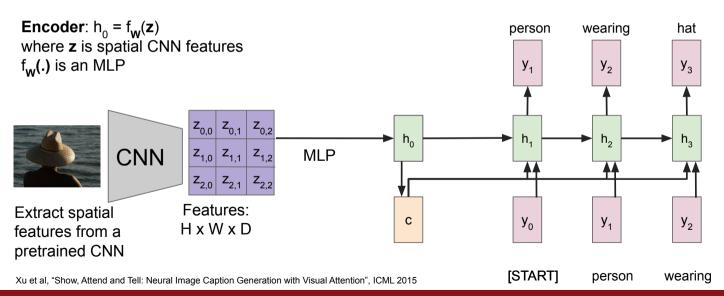

**Decoder**:  $y_t = g_v(y_{t-1}, h_{t-1}, c)$ where context vector c is often  $c = h_0$ 

Input: Image I

Output: Sequence  $y = y_1, y_2, ..., y_T$ 

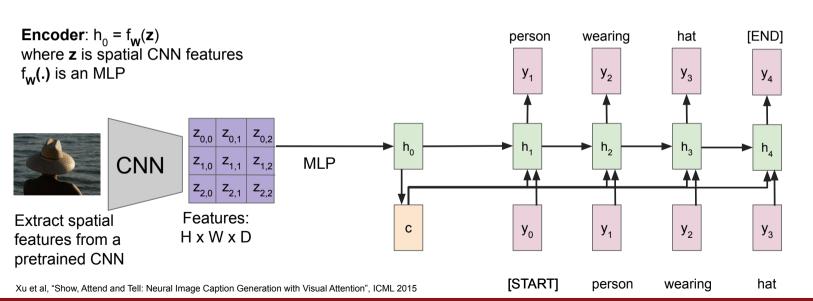

**Decoder**:  $y_t = g_v(y_{t-1}, h_{t-1}, c)$ where context vector c is often  $c = h_0$ 

Input: Image I

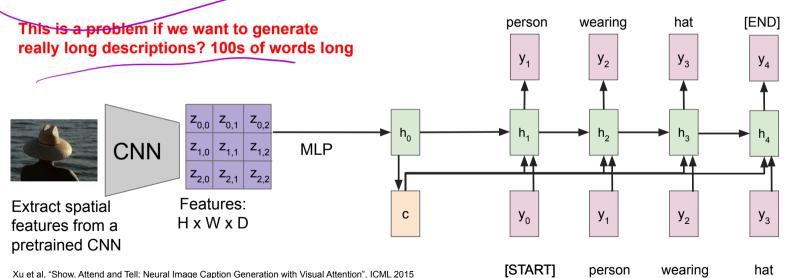

Output: Sequence  $y = y_1, y_2, ..., y_T$ 

**Decoder**:  $y_t = g_v(y_{t-1}, h_{t-1}, c)$ where context vector c is often  $c = h_0$ 

#### Problem: Input is "bottlenecked" through c

Model needs to encode everything it wants to say within c

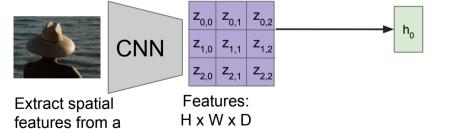

Attention idea: New context vector at every time step.

Each context vector will attend to different image regions

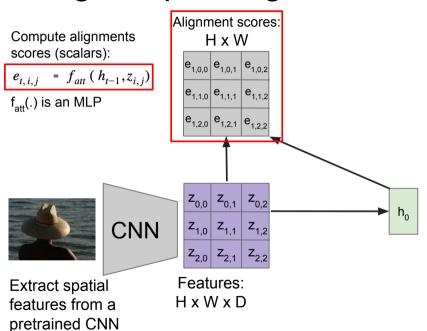

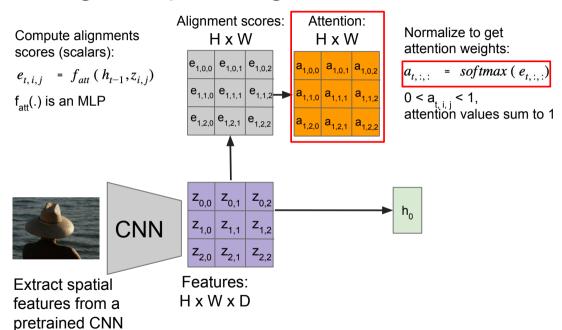

**Attention Saccades in humans** 

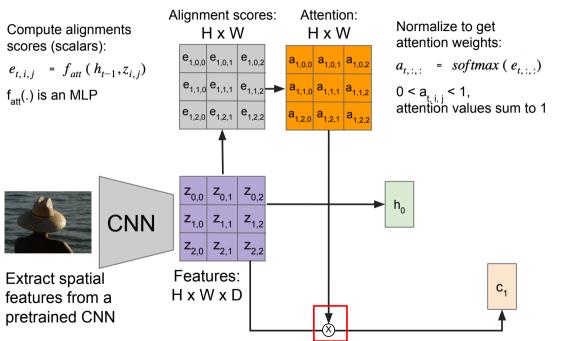

Xu et al, "Show, Attend and Tell: Neural Image Caption Generation with Visual Attention", ICML 2015

pretrained CNN

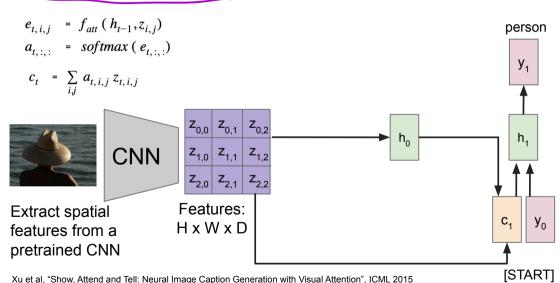

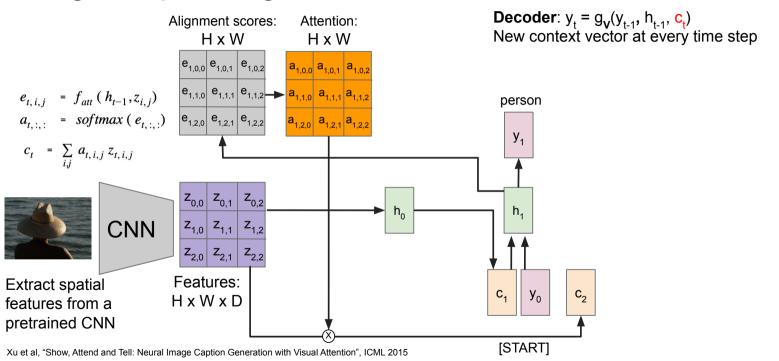

Compute context vector:

$$c_t = \sum_{i,j} a_{t,i,j} z_{t,i,j}$$

Each timestep of decoder uses a different context vector that looks at different parts of the input image

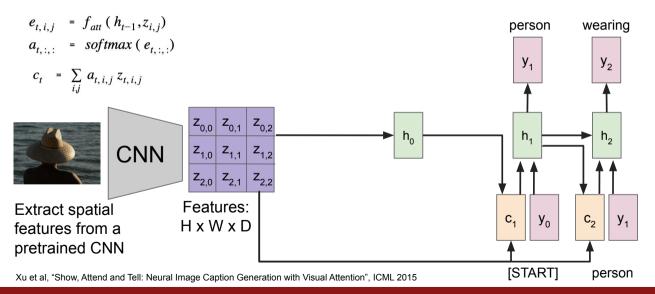

**Decoder**:  $y_t = g_V(y_{t-1}, h_{t-1}, c_t)$ New context vector at every time step

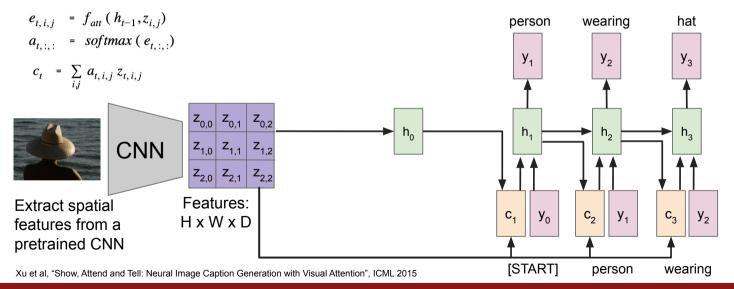

Each timestep of decoder uses a different context vector that looks at different parts of the input image

# Image Captioning with Attention

A woman is throwing a frisbee in a park.

A <u>dog</u> is standing on a hardwood floor.

A <u>stop</u> sign is on a road with a mountain in the background.

A little <u>girl</u> sitting on a bed with a teddy bear.

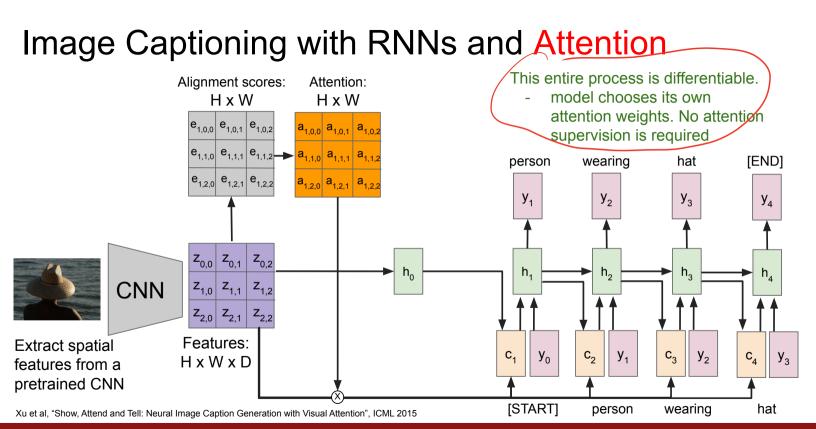

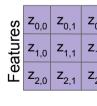

A group of <u>people</u> sitting on a boat in the water.

A giraffe standing in a forest with trees in the background.

Xu et al, "Show, Attend, and Tell: Neural Image Caption Generation with Visual Attention", ICML 2015
Figure copyright Kelvin Xu, Jimmy Lei Ba, Jamie Kiros, Kyunghyun Cho, Aaron Courville, Ruslan Salakhutdinov, Richard S. Zemel, and Yoshua Benchio, 2015. Reproduced with permission.

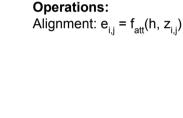

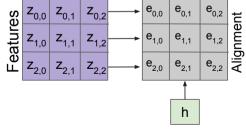

Inputs:

Features: **z** (shape: H x W x D) Query: **h** (shape: D)

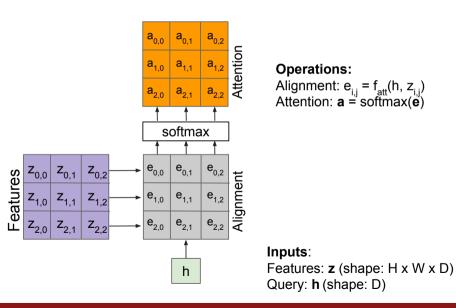

h

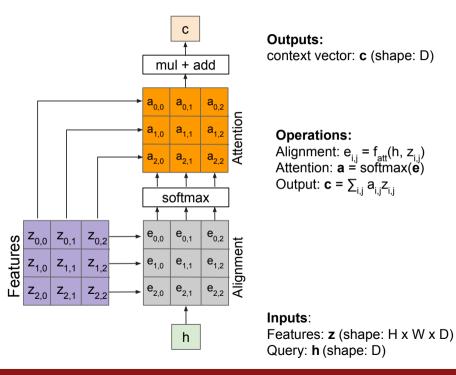

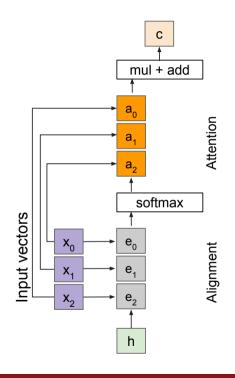

Inputs: Features: **z** (shape: H x W x D)

Query: **h** (shape: D)

### **Outputs:**

context vector: **c** (shape: D)

### **Operations:**

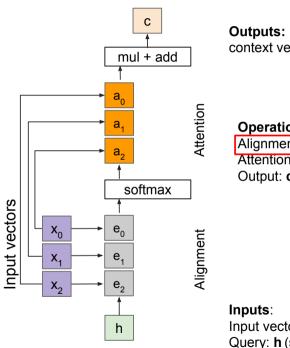

Alignment:  $e_i = f_{att}(h, x_i)$ Attention: **a** = softmax(**e**) Output:  $\mathbf{c} = \sum_{i} a_{i} x_{i}$ 

### Inputs:

Input vectors: x (shape: N x D) Query: h (shape: D)

Attention operation is permutation invariant Doesn't care about ordering of the features

- Stretch  $H \times W = N$  into N vectors

context vector: **c** (shape: D)

### Operations:

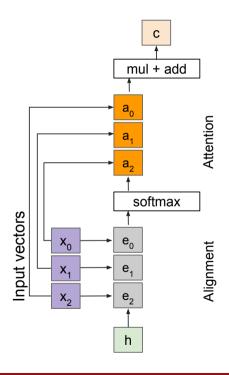

Alignment:  $e_i = h \cdot x_i$ Attention:  $\mathbf{a} = \text{softmax}(\mathbf{e})$ Output:  $\mathbf{c} = \sum_{i} a_{i} x_{i}$ 

### Change f<sub>att</sub>(.) to a simple dot product

only works well with key & value transformation trick (will mention in a few slides)

Input vectors: **x** (shape: N x D)

Query: **h** (shape: D)

### Outputs:

context vector: **c** (shape: D)

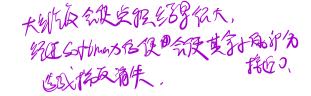

### **Operations:**

Alignment:  $\mathbf{e}_i = \mathbf{h} \cdot \mathbf{x}_i / \sqrt{D}$ Attention:  $\mathbf{a} = \text{softmax}(\mathbf{e})$ Output:  $\mathbf{c} = \sum_i a_i \mathbf{x}_i$ 

Inputs:

Input vectors: x (shape: N x D)

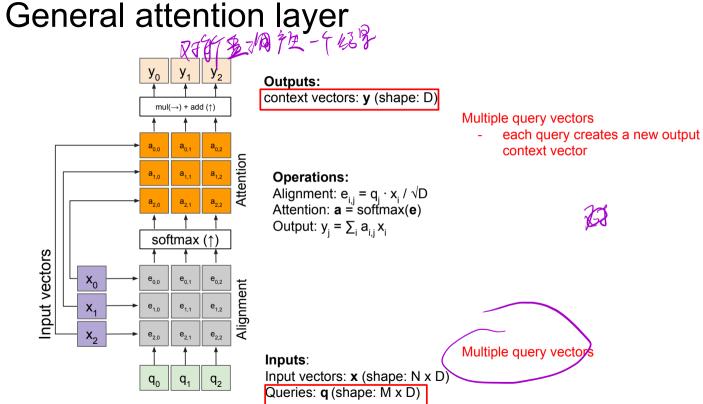

Query: h (shape: D)

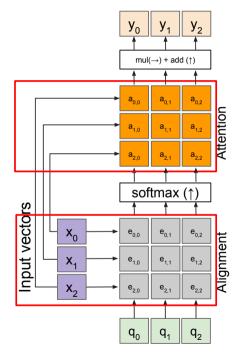

Change f<sub>att</sub>(.) to a scaled simple dot product

- Larger dimensions means more terms in the dot product sum.
- So, the variance of the logits is higher. Large magnitude vectors will produce much higher logits.
- So, the post-softmax distribution has lower-entropy, assuming logits are IID.

  Liltimately, these large magnitude vectors will cause softmax to peak and assign very little weight to all others
  - Divide by √D to reduce effect of large magnitude vectors

### **Outputs:**

context vectors: **y** (shape: D)

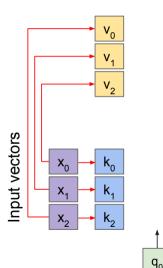

### Operations:

Alignment:  $e_{i,j} = q_j \cdot x_i / \sqrt{D}$ Attention:  $\mathbf{a} = \text{softmax}(\mathbf{e})$ Output:  $y_i = \sum_i a_{i,i} x_i$  Notice that the input vectors are used for both the alignment as well as the attention calculations.

 We can add more expressivity to the layer by adding a different FC layer before each of the two steps.

Inputs:

Input vectors: **x** (shape: N x D) Queries: **q** (shape: M x D)

### Operations:

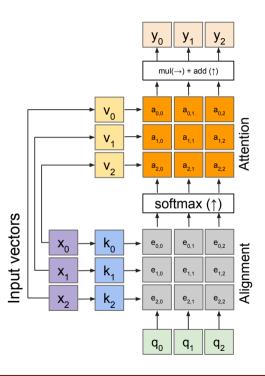

Key vectors:  $\mathbf{k} = \mathbf{x}\mathbf{W}_{\mathbf{k}}$ Value vectors:  $\mathbf{v} = \mathbf{x}\mathbf{W}_{\mathbf{v}}$ 

Inputs:

Input vectors:  $\mathbf{x}$  (shape: N x D) Queries:  $\mathbf{q}$  (shape: M x  $\mathbf{D}_{k}$ ) Notice that the input vectors are used for both the alignment as well as the attention calculations.

 We can add more expressivity to the layer by adding a different FC layer before each of the two steps.

### **Outputs:**

context vectors: **y** (shape: D)

The input and output dimensions can now change depending on the key and value FC layers

both the alignment as well as the attention calculations.

 We can add more expressivity to the layer by adding a different FC layer before each of the two steps.

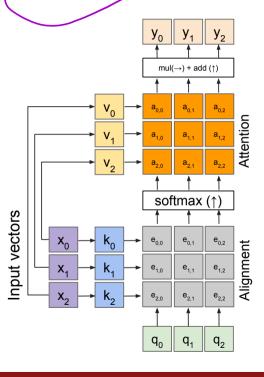

Notice that the input vectors are used for

### Operations:

Key vectors:  $\mathbf{k} = \mathbf{x}\mathbf{W}_k$ Value vectors:  $\mathbf{v} = \mathbf{x}\mathbf{W}_k$ Alignment:  $\mathbf{e}_{i,j} = \mathbf{q}_j \cdot \mathbf{k}_i / \sqrt{D}$ Attention:  $\mathbf{a} = \text{softmax}(\mathbf{e})$ Output:  $\mathbf{y}_i = \sum_i \mathbf{a}_{i,i} \mathbf{v}_i$ 

Inputs:

Input vectors:  $\mathbf{x}$  (shape: N x D) Queries:  $\mathbf{q}$  (shape: M x  $\mathbf{D}_{k}$ )

### **Outputs:**

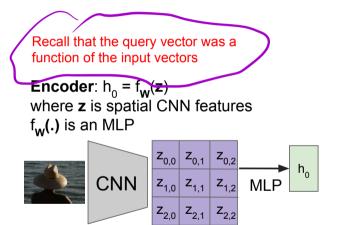

context vectors: **y** (shape: D\_)

### **Operations:**

Key vectors:  $\mathbf{k} = \mathbf{x}\mathbf{W}_{\mathbf{k}}$ Value vectors:  $\mathbf{v} = \mathbf{x} \hat{\mathbf{W}}$ Alignment:  $e_{i,j} = q_i \cdot k_i / \sqrt{D}$ Attention: **a** = softmax(**e**) Output:  $y_i = \sum_i a_{i,i} v_i$ 

Inputs:

Input vectors: **x** (shape: N x D) Queries:  $\mathbf{q}$  (shape: M x  $\mathbf{D}_{\nu}$ )

Z<sub>2,0</sub>

# Self attention layer

### Operations:

Key vectors:  $\mathbf{k} = \mathbf{x}\mathbf{W}_{\mathbf{k}}$ 

Value vectors: v = xW

Query vectors:  $\mathbf{q} = \mathbf{x} \mathbf{W}_{\mathbf{q}}$ Alignment:  $\mathbf{e}_{i,j} = \mathbf{q}_{i,j} \cdot \mathbf{k}_{i,j} / \sqrt{D}$ 

Attention: **a** = softmax(**e**)

Output:  $y_j = \sum_i a_{i,j} v_i$ 

We can calculate the query vectors from the input vectors, therefore, defining a "self-attention" layer.

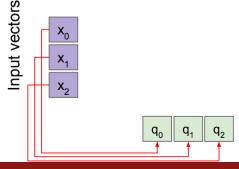

Instead, query vectors are calculated using a FC layer.

Inputs:

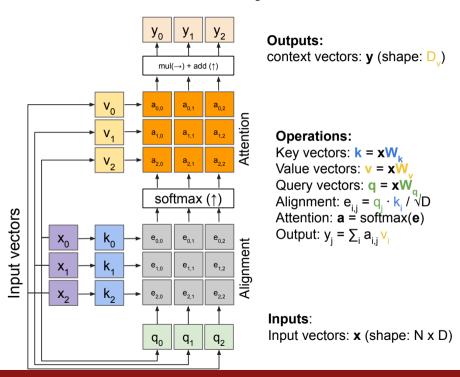

Input vectors: **x** (shape: N x D)

Queries: **q** (shape: M x D<sub>p</sub>)

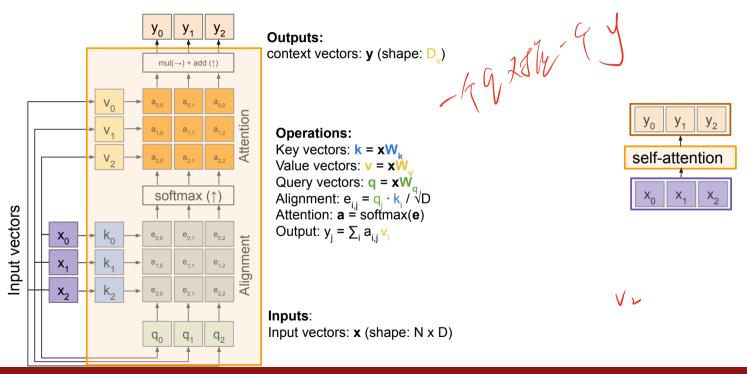

No input query vectors anymore

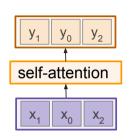

# Self attention layer

# Self attention layer - attends over sets of inputs

# Self attention layer - attends over sets of inputs

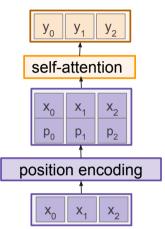

Permutation equivariant

Self-attention layer doesn't care about the orders of the inputs!

**Problem:** How can we encode ordered sequences like language or spatially ordered image features?

Concatenate/add special positional encoding  $\mathbf{p}_i$  to each input vector  $\mathbf{x}_i$ 

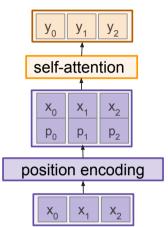

We use a function pos:  $N \rightarrow R^d$  to process the position j of the vector into a d-dimensional vector

So, 
$$p_j = pos(j)$$

### Desiderata of pos(.):

- It should output a **unique** encoding for each time-step (word's position in a sentence)
- Distance between any two time-steps should be consistent across sentences with different lengths.
- 3. Our model should generalize to **longer** sentences without any efforts. Its values should be bounded.
- 4. It must be **deterministic**.

Concatenate special positional encoding  $\mathbf{p}_{\mathbf{j}}$  to each input vector  $\mathbf{x}_{\mathbf{j}}$ 

We use a function *pos*:  $N \rightarrow R^d$  to process the position j of the vector into a d-dimensional vector

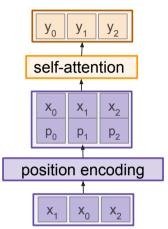

So,  $p_i = pos(j)$ 

### Options for *pos*(.)

- 1. Learn a lookup table:
  - $\circ$  Learn parameters to use for *pos*(t) for t ε [0, T)
  - Lookup table contains T x d parameters.

### Desiderata of pos(.):

- It should output a **unique** encoding for each time-step (word's position in a sentence)
- Distance between any two time-steps should be consistent across sentences with different lengths.
- 3. Our model should generalize to **longer** sentences without any efforts. Its values should be bounded.
- 4. It must be **deterministic**.

Concatenate special positional encoding  $\mathbf{p}_i$  to each input vector  $\mathbf{x}_i$ 

We use a function *pos*:  $N \rightarrow R^d$  to process the position j of the vector into a d-dimensional vector

So, 
$$p_i = pos(j)$$

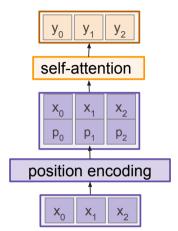

### Options for pos(.)

- 1. Learn a lookup table:
  - $\circ$  Learn parameters to use for *pos*(t) for t ε [0, T)
  - Lookup table contains T x d parameters.
- 2. Design a fixed function with the desiderata

$$\mathbf{p(t)} = \begin{bmatrix} \sin(\omega_1.t) \\ \cos(\omega_1.t) \\ \sin(\omega_2.t) \\ \cos(\omega_2.t) \\ \vdots \\ \sin(\omega_{d/2}.t) \\ \cos(\omega_{d/2}.t) \end{bmatrix}_d \quad \text{where}$$

where 
$$\omega_k = \frac{1}{10000^{2k/d}}$$

Vaswani et al, "Attention is all you need", NeurIPS 2017

Concatenate special positional encoding  $p_i$  to each input vector  $\mathbf{x}_i$ 

We use a function *pos*:  $N \rightarrow \mathbb{R}^d$  to process the position j of the vector into a d-dimensional vector

So, 
$$p_i = pos(j)$$

### Options for pos(.)

- 1. Learn a lookup table:
  - Learn parameters to use for pos(t) for t ε [0, T)
  - Lookup table contains T x d parameters.
- 2. Design a fixed function with the desiderata

# $\mathbf{p(t)} = \begin{bmatrix} \sin(\omega_1.t) \\ \cos(\omega_1.t) \\ \sin(\omega_2.t) \\ \cos(\omega_2.t) \\ \vdots \\ \sin(\omega_{d/2}.t) \\ \cos(\omega_{d/2}.t) \end{bmatrix}$

### Intuition:

$$0: \quad 0 \quad 0 \quad 0 \quad 0 \quad 8: \quad 1 \quad 0 \quad 0 \quad 0 \quad 1: \quad 0 \quad 0 \quad 0 \quad 1 \quad 9: \quad 1 \quad 0 \quad 0 \quad 1$$

$$2: \quad 0 \quad 0 \quad 1 \quad 0 \quad 10: \quad 1 \quad 0 \quad 1 \quad 0$$

$$3: \quad 0 \quad 0 \quad 1 \quad 1 \quad 11: \quad 1 \quad 0 \quad 1 \quad 1$$

$$4: \quad 0 \quad 1 \quad 0 \quad 0 \quad 12: \quad 1 \quad 1 \quad 0 \quad 0$$

$$5: \quad 0 \quad 1 \quad 0 \quad 1 \quad 13: \quad 1 \quad 1 \quad 0 \quad 1$$

$$6: \quad 0 \quad 1 \quad 1 \quad 0 \quad 14: \quad 1 \quad 1 \quad 1 \quad 0$$

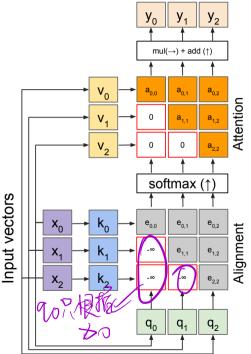

$$7: \quad 0 \quad 1 \quad 1 \quad 1 \quad 15: \quad 1 \quad 1 \quad 1 \quad 1$$

$$\mathbf{where} \quad \omega_k = \frac{1}{1 + 1 \cdot 1} \quad \mathbf{v}$$

Lecture 11 - 74

# Comparing RNNs to Transformer

#### **RNNs**

- (+) LSTMs work reasonably well for long sequences.
- (-) Expects an ordered sequences of inputs
  (-) Sequential computation. subsequent hidden states can only be computed after the previous ones are done.

#### **Transformer:**

- (+) Good at long sequences. Each attention calculation looks at all inputs.
- (+) Can operate over unordered sets or ordered sequences with positional encodings.
- (+) Parallel computation: All alignment and attention scores for all inputs can be done in parallel.
- (-) Requires a lot of memory: N x M alignment and attention scalers need to be calculated and stored for a single self-attention head. (but GPUs are getting bigger and better)

# Summary

- Adding **attention** to RNNs allows them to "attend" to different parts of the input at every time step
- The **general attention layer** is a new type of layer that can be used to design new neural network architectures
- Transformers are a type of layer that uses self-attention and layer norm.
  - It is highly scalable and highly parallelizable
  - Faster training, larger models, better performance across vision and language tasks
  - They are quickly replacing RNNs, LSTMs, and may(?) even replace convolutions.

Next time: Video Understanding
